WHAT IS CLAIMED IS:

- 1. A method for registering an off-line produced web having pre-produced objects longitudinally spaced at a pitch interval to a converting line manufacturing disposable absorbent articles, such as diapers, pull-ups, feminine hygiene articles, and the like, or a component of a disposable absorbent article, the off-line produced web being manipulated as a controlled web in order for the pre-produced object of the controlled web to be registered in relation to a target bias position and in control automatically with the pitched unit operation, and automatically phase the target position bias, the method comprising the steps of:
- a. providing a controlled web having pre-produced objects spaced at a controlled pitch interval, wherein the controlled web being provided at a controlled velocity in a machine direction;
- providing an actual bias position of the pre-produced object on the controlled web by detecting the pre-produced object with a sensor within a manufacturing cycle of a pitched unit operation;
- c. providing the target bias position at a desired position within a manufacturing cycle of the pitched unit operation;
- d. generating a correction signal based upon the actual bias position data and the target bias position constant;
- e. adjusting the controlled velocity of the controlled web in order to register the preproduced object of the controlled web in relation to the target bias position constant;
- f. coupling the pitched unit operation with a controlled web metering point by providing a converter position reference signal fed forward from the pitched unit operation functioning as an independent axis to the controlled web metering point functioning as a dependent axis in order for the pre-produced object of the controlled web be in phase automatically with the pitched unit operation; and
- g. adjusting the target position in order to phase the actual position based on the controlled web bias.
- 2. A method for registering an off-line produced web having pre-produced objects longitudinally spaced at a pitch interval to a converting line manufacturing disposable absorbent articles, such as diapers, pull-ups, feminine hygiene articles, and the like, or a component of a disposable absorbent article, the off-line produced web being manipulated as a controlled web in order for the pre-produced object of the controlled web to be registered in

relation to a target bias position and in control automatically with a first pitched unit operation and automatically phase the first pitched unit operation in order to maintain phase of the preproduced web with a second pitched unit operation, the method comprising the steps of:

- a. providing a controlled web having pre-produced objects spaced at a controlled pitch interval, wherein the controlled web being provided at a controlled velocity in a machine direction;
- b. providing an actual bias position of the pre-produced object on the controlled web by detecting the pre-produced object with a sensor within a manufacturing cycle of a pitched unit operation;
- c. providing the target bias position at a desired position within a manufacturing cycle of the first pitched unit operation;
- d. generating a correction signal based upon the actual bias position data and the target bias position constant;
- e. adjusting the controlled velocity of the controlled web in order to register the preproduced object of the controlled web in relation to the target bias position constant;
- f. coupling the first pitched unit operation with at least one controlled web metering point by providing a converter position reference signal fed forward from the second pitched unit operation functioning as an independent axis to the controlled web metering point functioning as a dependent axis in order for the pre-produced object of the controlled web be in phase automatically with the first pitched unit operation;
- g. inferring the pre-produced object pitch from the registration control loop output and using feedforward gain to automatically adjust a target phase offset position of the second pitched unit operation in order to compensate for variations in the pre-produced object pitch and to maintain the proper phase relationship.
- 3. The method of claim 2 wherein the first pitched unit operation is used to slit a diaper ear web into two separate webs and the second pitched unit operation is used to cut said webs into discrete parts for subsequent application onto another web.
- 4. The method of claim 3 wherein the diaper ear web is processed at a constant web tension.

- 5. The method of claim 1 wherein the controlled web is processed at a constant web tension.
- 6. The method of claim 2 wherein the controlled web is processed at a constant web tension.
